

# Plant-Seed Cycle

## Germination

Seeds need 3 things to germinate:

1. \_\_\_\_\_
2. \_\_\_\_\_
3. \_\_\_\_\_

## Pollination

Pollen from the anther must be moved to female parts of the plant. Three ways this can happen are:

1. \_\_\_\_\_
2. \_\_\_\_\_
3. \_\_\_\_\_

## Seed Dispersal

This is how seeds get from the plant to other places. Three ways for seeds to scatter are:

1. \_\_\_\_\_
2. \_\_\_\_\_
3. \_\_\_\_\_

## Fertilization

Use these words: seed, pollen, ovary, pistil.

The \_\_\_\_\_ from the anther lands on the \_\_\_\_\_.

A tube grows to the \_\_\_\_\_

A \_\_\_\_\_ begins to grow.
